DISPOSABLE PAPER DIAPER

Background of the Invention

5 The present invention concerns an improved disposable diaper, also identified as a "paper" diaper.

In the past, this type of disposable "paper" diaper was made by layering a water-absorbent layer such as paper or cotton over synthetic resin film that is impermeable to water, such as a polyethylene, then covering this water-abs and layer with a nonwoven fabric. However, when such per diapers are worn by infants or the elderly, the paper liaper must be fastened around the hips.

15

20

As a means of fastening such a diaper, a suitable string can be placed around the hips after putting on the paper diaper. However, the string-shaped piece causes a feeling of pressure when it is tied tightly and there is a danger of the paper diaper falling off if it is tied loosely. Moreover, not only is it necessary to furnish the string, etc. beforehand, but fastening the paper diaper with the string also has the drawback of consuming time and labor.

25 For this reason, belt strips came to be provided in a single piece with paper diapers. However, in this conventional type of paper diaper, the belt strips were furnished in an unfolded state in relation to the paper diaper, i.e., the base ends of the pair of belt strips on the right and left were connected to the two edges of the paper diaper so that the belt strips laid along the front edge and extended past the outer sides of the paper diaper. Therefore, the belt strips could catch on things

during handling or wear, or they could be damaged when pulled on forcibly. It was also necessary to fold the right and left belt strips on the upper face of each paper diaper when piling up a number of paper diapers.

5

10

15

Moreover, paper diapers are manufactured by successively overlapping the water-absorbent layer and long band-like nonwoven fabric over the long water-impermeable synthetic resin film that is being run continuously. However, to manufacture the paper diapers with the belt strips discussed above, in which the belt strips project from the outside of both sides of the paper diaper, the belt strips must be furnished and arranged on longitudinal sides of the band-like nonwoven fabric. This makes the manufacturing method extremely complicated.

Summary of the Invention

The present invention resolves these problems by proposing a paper diaper characterized by the fact that it is constructed such that the tips of the right and left belt strips are joined via a separable part, such as a perforation, or adhesive tape on the upper face of the main body of the paper diaper, so that the two sides can be separated from this separable part at the time of use and opened out.

Brief Description of the Drawings

30 Figure 1 is a perspective view of one embodiment of the present invention with portions of the view broken away for clarity;

Figure 2 is a cross-sectional view along line A-A of 35 Figure 1;

Figure 3 is a cross-sectional view along line B-B of Figure 1;

Figure 4 is a plan view of one embodiment of the present invention;

Figure 5 is a cross-sectional view of another embodiment of the present invention; and

10 Figure 6 is a perspective view of a product of the invention when being worn by the user.

Detailed Description of the Invention

Practical examples of the present invention are explained 15 through the figures. 1 is the main body of the long, rectangular paper diaper. The base ends of wide, rectangular right and left belt strips 2 2 that are made of a synthetic resin film such as polyethylene and nonwoven fabric or some other suitable material are glued by hot 20 melt or other suitable adhesion to the edges of both longitudinal sides of the main body of the diaper. Furthermore, these belt strips 2 2 are folded over at one end of the upper face of the paper diaper main body 1 and their tips that lie opposite each other are joined 25 together. Perforation 3 is provided longitudinally at the connected part, so that the right and left belt strips 2 2 can be separated and opened out by tearing at this perforation 3.

The tips of right and left belt strips 2 2 can be joined directly via perforation 3. In the figure, however, both sides of fixing strip 4, which is furnished with perforation 3 provided in the center along the entire length between the upper surfaces of the tips of these belt strips 2 2 and is made of synthetic resin film, are folded

30

35

5

10

over 1-2 times and glued by hot melt or other suitable adhesion so that the lower surfaces of both ends are joined to the upper surfaces of the tips of belt strips 2 2. With this construction, fixing strips 4 can be separated from perforation 3 while pulling their folded-over part upward. This facilitates separation.

5 5 are adhesive (hot melt) painted on the lower surfaces of both adjoining parts of fixing strips 4 so that perforation 3 is in the center. As shown in Figure 6, the paper diaper is fastened for wear by sticking this adhesive to the outer surface of the other end of paper diaper main body 1.

15 This adhesive 5 5 can also be painted on the lower surface of the tips of right and left belt strips 2 2.

In the above practical example, right and left belt strips 2 2 were only provided at one end on both sides of paper diaper main body 1. However, they can also be provided on both sides of both ends. In this instance, the right and left belt strips on one side are spread with adhesive and glued to the surface of the right and left belt strips on the other end during wear.

25

30

35

20

Furthermore, right and left belt strips 2 2 were provided with perforation 3 but, as illustrated in Figure 5, the separable tips of the right and left belt strips 2 2 can also be joined so that they can still be separated by adhesive tape strip 3a. In this case, as in the above practical example, the tips of right and left belt strips 2 2 can be connected directly, or the tips of fixing strips 4 4 that are each provided for the right and left belt strips 2 2 can be connected by adhesive tape strip 3a. It is only necessary to form separable part 3 by a perforation, adhesive tape strip, etc.

Various constructions can be used for the paper diaper main body 1. The one shown in the figure has a waterabsorbent layer 7 made of a paper or cotton layer or a pulp mat placed on top of long, rectangular waterimpermeable synthetic resin film 6 such as polyethylene, 5 polyester, polypropylene, etc. The upper surfaces of both sides of this water-absorbent layer 7 are folded over The lower surboth sides of the above-mentioned film 6. faces of both sides of the long, rectangular nonwoven fabric 8 are glued to this folded-over upper surface with 10 a heat or pressure-sensitive adhesive or some other suitable adhesive. Moreover, two inclined cuts, each oriented toward the center of water-absorbent layer 7, are provided on both sides of water-absorbent layer 7. The longitudinal line that joins the inner edges between these inclined 15 cuts 9 9 is called fold 10. Trapezoidal parts 7a 7a enclosed by this fold 10 and inclined cuts 9 9 are folded over on the upper surface of the water-absorbent layer of this part improves water absorption and retention. several elastic strips 11 are provided longitudinally 20 between the edges of inclined cuts 9 9, the centers of both edges of paper diaper main body 1 fit sufficiently snugly to the inner thigh and prevent leakage.

Thus, the present invention is a paper diaper characterized by the fact that, in a paper diaper furnished with belt strips 2 2, at the edges of at least one end of the two ends of paper diaper main body 1, these belt strips 2 2 are folded over on the upper surface of paper diaper main body 1 and their tips that lie opposite one another are joined together via separable part 3, which is a perforation or adhesive tape strip, etc. Since these belt strips 2 2 do not project outside the paper diaper main body 1, even though belt strips 2 2 are provided at the edges of both sides of paper diaper main body 1, damage by cutting belt strips 2 2, etc. during handling can be

prevented. This also makes it easier and smoother to pile up several paper diapers. During use, the diaper can be put on easily by separating right and left belt strips 2 2 from separable part 3 after arranging the main body of the paper diaper 1 in a U-shape passing under the thighs. When putting the diaper on, belt strips 2 2 do not get in the way and are not accidentally damaged since the right and left belt strips 2 2 are joined to the upper surface of paper diaper main body 1 via separable part 3.

10

15

5

Moreover, since belt strips 2 2 are provided joined on the upper surface of paper diaper main body 1, the paper diaper can be manufactured according to the conventional manufacturing process merely by situating belt strips 2 that are joined in the centers via separable part 3 along and gluing them to the upper surface of the nonwoven fabric that forms paper diaper main body 1.

5

Claim

1. Paper diaper characterized by the fact that, in a paper diaper furnished with belt strips (2) (2) at the edges of at least one of the two ends of the main body (1) of the paper diaper, these belt strips (2) (2) are folded over on the upper surface of the paper diaper main body (1) and their opposite ends are joined together via a separable part (3) such as a perforation.
